# LED Connection Instruction

About the Transformer

The transformer comes with distinct left and right ends for straightforward connections. One end handles power input, while the opposite end manages the output to the Lighting Fixtures.

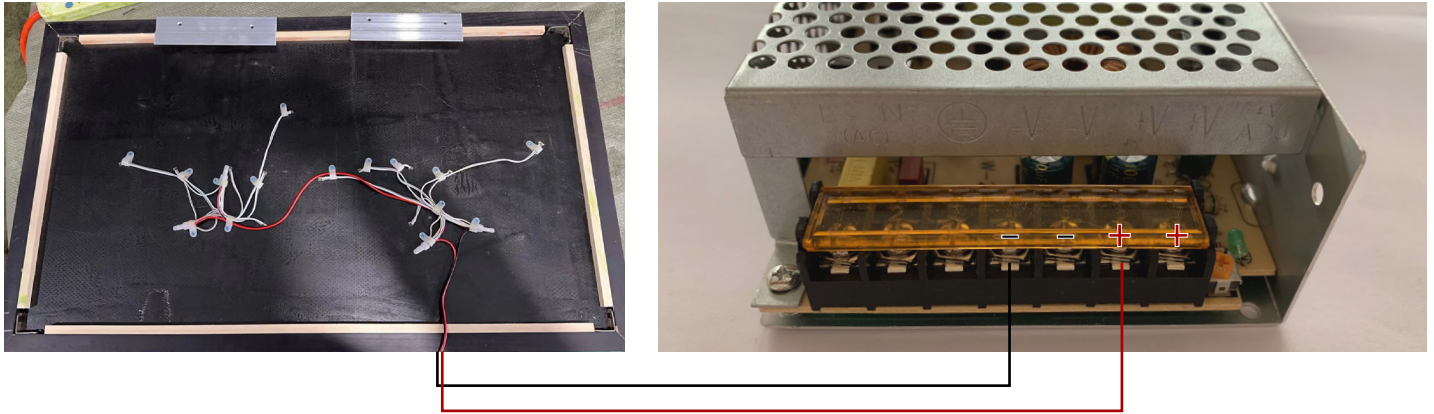

How to Install

1. Connecting the Power Cord to the Transformer:

The power cord consists of three wires: the red wire is live, the blue wire is neutral, and the yellow wire is ground. After stripping the black outer layer, connect these three wires to the corresponding terminals on the transformer. The ground wire can be left unconnected, but it should be insulated with electrical tape.

2. Connecting the LED Light to the Transformer:

For the LED light connection: We have already combined all the gray and white wires into one red wire and one black wire. Connect the red wire to the "+" terminal of the transformer and the black wire to the "-" terminal.

3. Powering On (for plug-in cord users):

Plug in the power cord.
The LED should illuminate immediately.

Please Note

*Please follow these steps carefully to ensure the correct setup.
*Ensure these connections are correct to prevent any issues.
